Definitions of Managed Objects for Very High Speed Digital Subscriber Lines (VDSL)

Status of this Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Abstract

This document defines a Management Information Base (MIB) module for use with network management protocols in the Internet community. In particular, it describes objects used for managing Very High Speed Digital Subscriber Line (VDSL) interfaces.

1. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC 3410 [RFC3410].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIv2, which is described in STD 58, RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579] and STD 58, RFC 2580 [RFC2580].

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

2. Overview

This document describes an SNMP MIB module for managing VDSL Lines. These definitions are based upon the specifications for VDSL as defined in T1E1, ETSI, and ITU documentation [T1E1311, T1E1011, T1E1013, ETSI2701, ETSI2702, ITU9931, ITU9971].

The MIB module is located in the MIB tree under MIB 2 transmission, as discussed in the MIB-2 Integration (RFC 2863 [RFC2863]) section of this document.

2.1. Relationship of the VDSL Line MIB Module to other MIB Modules

This section outlines the relationship of this MIB with other MIBs described in RFCs. Specifically, IF-MIB as presented in RFC 2863 [RFC2863] is discussed.

2.1.1. General IF-MIB Integration (RFC 2863)

The VDSL Line MIB specifies the detailed attributes of a data interface. As such, it needs to integrate with RFC 2863 [RFC2863]. The IANA has assigned the following ifType to VDSL:

```
IANAifType ::= TEXTUAL-CONVENTION
...
SYNTAX INTEGER {
...
vdsl(97), -- Very H-speed Digital Subscrib. Loop
...
}
```

Additionally, a VDSL line may contain an optional fast channel and an optional interleaved channel which also integrate into RFC 2863 [RFC2863]. The IANA has assigned the following ifTypes to these channels:

```
IANAifType ::= TEXTUAL-CONVENTION
...
SYNTAX INTEGER {
...
interleave (124), -- Interleave channel
fast (125), -- Fast channel
...
}
```

2.1.2. Usage of ifTable

The MIB branch identified by this ifType contains tables appropriate for this interface type. Most tables extend the ifEntry table, and are indexed by ifIndex. For interfaces in systems implementing this MIB, those table entries indexed by ifIndex MUST be persistent.

The following attributes are part of the mandatory ifGeneral group in RFC 2863 [RFC2863], and are not duplicated in the VDSL Line MIB.

=====	
ifIndex	Interface index.
ifDescr	See interfaces MIB [RFC2863].
ifType	vdsl(97), interleave(124), or fast(125)
ifSpeed	Set as appropriate.
ifPhysAddress	This object MUST have an octet string with zero length.
ifAdminStatus	See interfaces MIB [RFC2863].

ifOperStatus	See interfaces MIB [RFC2863].
ifLastChange	See interfaces MIB [RFC2863].
ifName	See interfaces MIB [RFC2863].
ifHighSpeed	Set as appropriate.
ifConnectorPresent	Set as appropriate.
ifLinkUpDownTrapEnable	Default to enabled(1).

=====
Figure 1: Use of ifTable Objects

Section 2.3, below, describes the structure of this MIB in relation to ifEntry in greater detail.

2.2. Conventions used in the MIB Module

2.2.1. Naming Conventions

- A. Vtuc -- (VTUC) transceiver at near (Central) end of line
- B. Vtur -- (VTUR) transceiver at Remote end of line
- C. Vtu -- One of either Vtuc or Vtur
- D. Curr -- Current
- E. Prev -- Previous
- F. Attn -- Attenuation
- G. ES -- Errored Second
- H. SES -- Severely Errored Second
- I. UAS -- Unavailable Second
- J. LCS -- Line Code Specific
- K. Lof -- Loss of Frame
- L. Lol -- Loss of Link
- M. Los -- Loss of Signal
- N. Lpr -- Loss of Power
- O. xxss -- Sum of Seconds in which xxx has occurred
(e.g., xxx = Lof, Los, Lpr, Lol)
- P. Max -- Maximum
- Q. Mgn -- Margin
- R. Min -- Minimum
- S. Psd -- Power Spectral Density
- T. Snr -- Signal to Noise Ratio
- U. Tx -- Transmit
- V. Blks -- Blocks

2.2.2. Textual Conventions

The following textual conventions are defined to reflect the line topology in the MIB (further discussed in the following section) and to define the behavior of the statistics to be maintained by an agent.

- o VdslLineCodingType :

Attributes with this syntax identify the line coding used. Specified as an INTEGER, the three values are:

other(1) -- none of the following
mcm(2) -- Multiple Carrier Modulation
scm(3) -- Single Carrier Modulation

- o VdslLineEntity :

Attributes with this syntax reference the two sides of a line. Specified as an INTEGER, the two values are:

vtuc(1) -- central site transceiver
vtur(2) -- remote site transceiver

2.3 Structure

The MIB is structured into the following MIB groups:

- o vdsListGroup :

This group supports all line code independent MIB objects found in this MIB. The following tables contain objects permitted for ifType vdsl(97):

- vdsLineTable
- vdsPhysTable
- vdsPerfDataTable
- vdsPerfIntervalTable
- vdsPerf1DayIntervalTable
- vdsLineConfProfileTable
- vdsLineAlarmConfProfileTable

The following tables contain objects permitted for ifTypes interleave(124) and (fast):

- vdsChanTable
- vdsChanPerfDataTable
- vdsChanPerfIntervalTable
- vdsChanPerf1DayIntervalTable

Figure 2, below, displays the relationship of the tables in the vdsGroup to ifEntry (and each other):

```

ifEntry(ifType=97)    ---> vdsLineTableEntry 1:(0 to 1)

vdsLineTableEntry     ---> vdsPhysTableEntry 1:(0 to 2)
                      ---> vdsPerfDataEntry 1:(0 to 2)
                      ---> vdsLineConfProfileEntry 1:(0 to 1)
                      ---> vdsLineAlarmConfProfileEntry 1:(0 to 1)

vdsPhysTableEntry    ---> vdsPerfIntervalEntry 1:(0 to 96)
                      ---> vdsPerf1DayIntervalEntry 1:(0 to 30)

ifEntry(ifType=124)   ---> vdsChanEntry 1:(0 to 2)
                      ---> vdsChanPerfDataEntry 1:(0 to 2)

ifEntry(ifType=125)   ---> vdsChanEntry 1:(0 to 2)
                      ---> vdsChanPerfDataEntry 1:(0 to 2)

vdsChanEntry         ---> vdsChanPerfIntervalEntry 1:(0 to 96)
                      ---> vdsChan1DayPerfIntervalEntry 1:(0 to 30)

```

Figure 2: Table Relationships

- o vdsNotificationGroup :

This group contains definitions of VDSL line notifications. Section 2.6, below, presents greater detail on the notifications defined within the MIB module.

2.3.1. Line Topology

A VDSL Line consists of two units - a Vtuc (the central transceiver unit) and a Vtur (the remote transceiver unit).

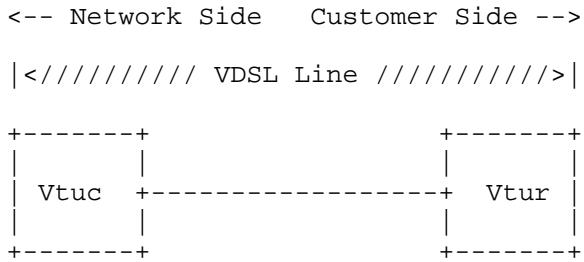

Figure 3: General topology for a VDSL Line

2.4. Counters, Interval Buckets and Thresholds

For Loss of Frame (lof), Loss of Link (lol), Loss of Signal (los), and Loss of Power (lpr), Errorred Seconds (ES), Severely Errorred Seconds (SES), and Unavailable Seconds (UAS) there are event counters, current 15-minute, 0 to 96 15-minute history bucket(s), and 0 to 30 1-day history bucket(s) of "interval-counters". Each current 15-minute event bucket has an associated threshold notification.

Each of these counters uses the textual conventions defined in the HC-PerfHist-TC-MIB [RFC3705]. The HC-PerfHist-TC-MIB defines 64-bit versions of the textual conventions found in RFC 3593 [RFC3593].

There is no requirement for an agent to ensure a fixed relationship between the start of a fifteen minute interval and any wall clock; however, some implementations may align the fifteen minute intervals with quarter hours. Likewise, an implementation may choose to align one day intervals with the start of a day.

Counters are not reset when a Vtu is reinitialized, only when the agent is reset or reinitialized (or under specific request outside the scope of this MIB module).

2.5. Profiles

As a managed node can handle a large number of Vtus, (e.g., hundreds or perhaps thousands of lines), provisioning every parameter on every Vtu may become burdensome. Moreover, most lines are provisioned identically with the same set of parameters. To simplify the provisioning process, this MIB makes use of profiles. A profile is a set of parameters that can be shared by multiple lines using the same configuration.

The following profiles are used in this MIB module:

- o Line Configuration Profiles - Line configuration profiles contain parameters for configuring VDSL lines. They are defined in the vdslLineConfProfileTable.
- o Alarm Configuration Profiles - These profiles contain parameters for configuring alarm thresholds for VDSL transceivers. These profiles are defined in the vdslLineAlarmConfProfileTable.

One or more lines may be configured to share parameters of a single profile by setting their vdslLineConfProfile objects to the value of this profile. If a change is made to the profile, all lines that refer to it will be reconfigured to the changed parameters. Before a profile can be deleted or taken out of service it must be first unreferenced from all associated lines.

Implementations MUST provide a default profile with an index value of 'DEFVAL' for each profile type. The values of the associated parameters will be vendor specific unless otherwise indicated in this document. Before a line's profiles have been set, these profiles will be automatically used by setting vdsllineConfProfile and vdsllineAlarmConfProfile to 'DEFVAL' where appropriate. This default profile name, 'DEFVAL', is considered reserved in the context of profiles defined in this MIB module.

Profiles are created, assigned, and deleted dynamically using the profile name and profile row status in each of the ten profile tables (nine line configuration tables and one alarm configuration table).

Profile changes MUST take effect immediately. These changes MAY result in a restart (hard reset or soft restart) of the units on the line.

2.6. Notifications

The ability to generate the SNMP notifications coldStart/WarmStart (per [RFC3418]) which are per agent (e.g., per Digital Subscriber Line Access Multiplexer, or DSLAM, in such a device), and linkUp/linkDown (per [RFC2863]) which are per interface (i.e., VDSL line) is required.

The notifications defined in this MIB are for initialization failure and for the threshold crossings associated with the following events: lof, lol, los, lpr, ES, SES, and UAS. Each threshold has its own enable/threshold value. When that value is 0, the notification is disabled.

A linkDown notification MAY be generated whenever any of lof, lol, los, lpr, ES, SES, or UAS threshold crossing event (as defined in this MIB module) occurs. The corresponding linkUp notification MAY be sent when all link failure conditions are cleared.

The vds1PhysCurrStatus is a bitmask representing all outstanding error conditions associated with a particular VDSL transceiver. Note that since status of remote transceivers is obtained via the EOC, this information may be unavailable for units that are unreachable via the EOC during a line error condition. Therefore, not all conditions may always be included in its current status. Notifications corresponding to the bit fields in this object are defined.

A threshold notification occurs whenever the corresponding current 15-minute interval error counter becomes equal to, or exceeds the threshold value. One notification may be sent per interval per interface. Since the current 15-minute counters are reset to 0 every 15 minutes, if the condition persists, the notification may recur as often as every 15 minutes. For example, to get a notification whenever a "loss of" event occurs (but at most once every 15 minutes), set the corresponding threshold to 1. The agent will generate a notification when the event originally occurs.

Note that the Network Management System, or NMS, may receive a linkDown notification, as well, if enabled (via ifLinkUpDownTrapEnable [RFC2863]). At the beginning of the next 15 minute interval, the counter is reset. When the first second goes by and the event occurs, the current interval bucket will be 1, which equals the threshold and the notification will be sent again.

2.7. Persistence

All read-write and read-create objects defined in this MIB module SHOULD be stored persistently. Following is an exhaustive list of these persistent objects:

- vdslLineConfProfile
- vdslLineAlarmConfProfile
- vdslLineConfProfileName
- vdslLineConfDownRateMode
- vdslLineConfUpRateMode
- vdslLineConfDownMaxPwr
- vdslLineConfUpMaxPwr
- vdslLineConfDownMaxSnrMgn
- vdslLineConfDownMinSnrMgn
- vdslLineConfDownTargetSnrMgn
- vdslLineConfUpMaxSnrMgn
- vdsllineConfUpMinSnrMgn
- vdsllineConfUpTargetSnrMgn
- vdsllineConfDownFastMaxDataRate
- vdsllineConfDownFastMinDataRate
- vdsllineConfDownSlowMaxDataRate
- vdsllineConfDownSlowMinDataRate
- vdsllineConfUpFastMaxDataRate
- vdsllineConfUpFastMinDataRate
- vdsllineConfUpSlowMaxDataRate
- vdsllineConfUpSlowMinDataRate
- vdsllineConfDownRateRatio
- vdsllineConfUpRateRatio
- vdsllineConfDownMaxInterDelay
- vdsllineConfUpMaxInterDelay
- vdsllineConfDownPboControl
- vdsllineConfUpPboControl
- vdsllineConfDownPboLevel
- vdsllineConfUpPboLevel
- vdsllineConfDeploymentScenario
- vdsllineConfAdslPresence
- vdsllineConfApplicableStandard
- vdsllineConfBandPlan
- vdsllineConfBandPlanFx
- vdsllineConfBandOptUsage
- vdsllineConfUpPsdTemplate
- vdsllineConfDownPsdTemplate
- vdsllineConfHamBandMask
- vdsllineConfCustomNotch1Start
- vdsllineConfCustomNotch1Stop
- vdsllineConfCustomNotch2Start
- vdsllineConfCustomNotch2Stop

- vdslLineConfDownTargetSlowBurst
- vdslLineConfUpTargetSlowBurst
- vdslLineConfDownMaxFastFec
- vdslLineConfUpMaxFastFec
- vdslLineConfLineType
- vdslLineConfProfRowStatus
- vdsLineAlarmConfProfileName
- vdsLineAlarmConfThresh15MinLofs
- vdsLineAlarmConfThresh15MinLoss
- vdsLineAlarmConfThresh15MinLprs
- vdsLineAlarmConfThresh15MinLols
- vdsLineAlarmConfThresh15MinESS
- vdsLineAlarmConfThresh15MinSESS
- vdsLineAlarmConfThresh15MinUASS
- vdsLineAlarmConfInitFailure
- vdsLineAlarmConfProfRowStatus

It should also be noted that interface indices in this MIB are maintained persistently. VACM data relating to these SHOULD be stored persistently as well [RFC3415].

3. Conformance and Compliance

For VDSL lines, the following groups are mandatory:

- vdsGroup
- vdsNotificationGroup

DESCRIPTION

"The MIB module defining objects for the management of a pair of VDSL transceivers at each end of the VDSL line. Each such line has an entry in an ifTable which may include multiple transceiver lines. An agent may reside at either end of the VDSL line. However, the MIB is designed to require no management communication between them beyond that inherent in the low-level VDSL line protocol. The agent may monitor and control this protocol for its needs.

VDSL lines may support optional Fast or Interleaved channels. If these are supported, additional entries corresponding to the supported channels must be created in the ifTable. Thus a VDSL line that supports both channels will have three entries in the ifTable, one for each physical, fast, and interleaved, whose ifType values are equal to vdsl(97), fast(125), and interleaved(124), respectively. The ifStackTable is used to represent the relationship between the entries.

Naming Conventions:

```

Vtuc -- (VTUC) transceiver at near (Central) end of line
Vtur -- (VTUR) transceiver at Remote end of line
Vtu -- One of either Vtuc or Vtur
Curr -- Current
Prev -- Previous
Attn -- Attenuation
ES -- Errored Second.
SES -- Severely Errored Second
UAS -- Unavailable Second
LCS -- Line Code Specific
Lof -- Loss of Frame
Lol -- Loss of Link
Los -- Loss of Signal
Lpr -- Loss of Power
xxxs -- Sum of Seconds in which xxx has occurred
       (e.g., xxx = Lof, Los, Lpr, Lol)
Max -- Maximum
Mgn -- Margin
Min -- Minimum
Psd -- Power Spectral Density
Snr -- Signal to Noise Ratio
Tx -- Transmit
Blks -- Blocks

```

vdslPhysCurrStatus OBJECT-TYPE
  SYNTAX      BITS
  {
    noDefect(0),
    lossOfFraming(1),
    lossOfSignal(2),
    lossOfPower(3),
    lossOfSignalQuality(4),
    lossOfLink(5),
    dataInitFailure(6),
    configInitFailure(7),
    protocolInitFailure(8),
    noPeerVtuPresent(9)
  }
  MAX-ACCESS  read-only
  STATUS      current
  DESCRIPTION
    "Indicates current state of the Vtu line. This is a
     bit-map of possible conditions. The various bit
     positions are:
  "
  0  noDefect          There are no defects on the line.
  1  lossOfFraming     Vtu failure due to not receiving
                      a valid frame.
  2  lossOfSignal      Vtu failure due to not receiving
                      signal.
  3  lossOfPower       Vtu failure due to loss of power.
  4  lossOfSignalQuality Loss of Signal Quality is declared
                          when the Noise Margin falls below
                          the Minimum Noise Margin, or the
                          bit-error-rate exceeds 10^-7.
  5  lossOfLink        Vtu failure due to inability to
                      link with peer Vtu. Set whenever
                      the transceiver is in the 'Warm
                      Start' state.
  6  dataInitFailure   Vtu failure during initialization
                      due to bit errors corrupting
                      startup exchange data.

```

```

7 configInitFailure      Vtu failure during initialization
                           due to peer Vtu not able to
                           support requested configuration.

8 protocolInitFailure   Vtu failure during initialization
                           due to incompatible protocol used
                           by the peer Vtu.

9 noPeerVtuPresent      Vtu failure during initialization
                           due to no activation sequence
                           detected from peer Vtu.

    MAX-ACCESS  read-create
    STATUS      current
    DESCRIPTION
        "The transmit power spectral density mask code, used
         to avoid interference with HAM (Handheld Amateur Radio)
         radio bands by introducing power control (notching) in one
         or more of these bands."

```

Amateur radio band notching is defined in the VDSL spectrum as follows:

Band	Start Frequency	Stop Frequency
30m	1810 kHz	2000 kHz
40m	3500 kHz	3800 kHz (ETSI); 4000 kHz (ANSI)
80m	7000 kHz	7100 kHz (ETSI); 7300 kHz (ANSI)
160m	10100 kHz	10150 kHz

Notching for each standard band can be enabled or disabled via the bit mask.

Two custom notches may be specified. If either of these are enabled via the bit mask, then the following objects MUST be specified:

If customNotch1 is enabled, then both
 vdsLineConfCustomNotch1Start
 vdsLineConfCustomNotch1Stop
 MUST be specified.

If customNotch2 is enabled, then both
 vdsLineConfCustomNotch2Start
 vdsLineConfCustomNotch2Stop
 MUST be specified."

  }
  MAX-ACCESS  read-create
  STATUS      current
  DESCRIPTION
    "This parameter provisions the VDSL physical entity at
    start-up by defining whether and how the line will be
    channelized, i.e., which channel type(s) are supported.
    If the line is to be channelized, the value will be other
    than noChannel(1).

This configuration can be activated only during start-up.
Afterwards, the value of vdsLineType coincides with the
value of vdsLineConfLineType. Depending on this value,
the corresponding entries in the ifTable for the
interleaved and the fast channels are enabled or disabled
according to the value of their ifOperStatus.

Defined values are:

```

```

noChannel(1)          -- no channels exist
fastOnly(2)           -- only fast channel exists
interleavedOnly(3)    -- only interleaved channel exists

5. Security Considerations

There are a number of management objects defined in this MIB module with a MAX-ACCESS clause of read-write and/or read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control even GET and/or NOTIFY access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP.

VDSL layer connectivity from the Vtun will permit the subscriber to manipulate both the VDSL link directly and the VDSL embedded operations channel (EOC) for their own loop. For example, unchecked or unfiltered fluctuations initiated by the subscriber could generate sufficient notifications to potentially overwhelm either the management interface to the network or the element manager.

Additionally, allowing write access to configuration data may allow an end-user to increase their service levels or affect other end-users in either a positive or negative manner. For this reason, the following tables should be considered to contain sensitive information:

- vdsLineTable
- vdsLineConfProfileTable
- vdsLineAlarmConfProfileTable

Individual line utilization information, available via the performance tables, may be considered sensitive. For example, if an end-user has a far lower line utilization during certain periods of the day, it may indicate an empty office or residence. For these reasons, the following tables should be considered to contain sensitive information:

- vdsPerfDataTable
- vdsPerfIntervalTable
- vdsPerf1DayIntervalTable

Further, notifications generated by agents implementing this MIB will contain threshold and performance information.

It is thus important to control even GET access to the objects within these tables and possibly to even encrypt the values of these objects when sending them over the network via SNMP. Not all versions of SNMP provide features for such a secure environment.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPSec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

It is RECOMMENDED that implementers consider the security features as provided by the SNMPv3 framework (see [RFC3410], section 8), including full support for the SNMPv3 cryptographic mechanisms (for authentication and privacy).

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

This document and the information contained herein are provided on an "AS IS" basis and THE CONTRIBUTOR, THE ORGANIZATION HE/SHE REPRESENTS OR IS SPONSORED BY (IF ANY), THE INTERNET SOCIETY AND THE INTERNET ENGINEERING TASK FORCE DISCLAIM ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

Intellectual Property

The IETF takes no position regarding the validity or scope of any Intellectual Property Rights or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; nor does it represent that it has made any independent effort to identify any such rights. Information on the procedures with respect to rights in RFC documents can be found in BCP 78 and BCP 79.

Copies of IPR disclosures made to the IETF Secretariat and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this specification can be obtained from the IETF on-line IPR repository at <http://www.ietf.org/ipr>.

The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights that may cover technology that may be required to implement this standard. Please address the information to the IETF at ietf-ipr@ietf.org.
